HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

DETAILED ACTION

Reason for Allowance

1. The following is an examiner's statement of reasons for allowance: Claims 1-4, 6, 11, and 14-18 are allowed.

The present invention is directed to code translation wherein an input code is a video stream of MPEG-2 and is translated to an output code of a predetermined format wherein the input code has a user extension area of GOP layer and the output code has user extension areas of picture layer and user data for closed caption is placed in each of these areas whereas it is further assumed that one GOP includes 15 frames at the maximum, and only user data corresponding to some leading frames are included in one GOP. Before translation, only one out of 15 frames is provided with a 4-byte start code wherein after translation, every frame is provided with a 4-byte start code of user data and thus, even when only the start codes are considered on the assumption that there are 30 frames per second, the bit rate is increased by translation and the position of user data after translation is not strictly determined as the user data for closed caption is not required to have a perfect synchronization with picture data.

Regarding claim 1, a code translation method comprising the steps of: receiving an input code stored in a hierarchical data structure, the input code including a first value in a parameter of the hierarchical data structure which determines an allowable range of data amount in the input code, user data a first layer of the hierarchical data structure, and main data a second layer of the hierarchical data structure; storing the user data and main data in a data buffer; and generating an output code stored in the

hierarchical data structure, the output code including the stored main data, the stored user data in a layer of the hierarchical data structure other than the first layer, and a second value in the parameter of the hierarchical data structure which determines an allowable range of data amount in the output code, the second value being different from the first value to reflect of data amount in the input code effected by moving the user data from the input code to the output code; wherein the stored main data included in the output code is identical to the main data included in the input code.

Regarding claim 11, A code translation device comprising: a data analyzing section adapted to identify in an input code stored in a hierarchical data structure a first value in a parameter of the hierarchical data structure which determines allowable range of data amount in the input code, user data in a first layer of the hierarchical data structure, and main data in a second layer of the hierarchical data structure; and a multiplexing section which produces an output code stored in a hierarchical data structure, the output code including the stored main data, the user data in a layer of the hierarchical data structure other than the first layer, a second value in the parameter of the hierarchical data structure which determines an allowable range of data amount in the output code, the second value being different from the first value to reflect a change from the allowable range of data amount in the input code effected by moving the user data from the input code to the output code; wherein the main data included in the output code is identical to the main data included in the input code.

The closet prior art Nagai et al. (US 2007/0160141 A1) discloses a picture encoding method includes receiving an input video signal, encoding the video signal

Art Unit: 2473

using a reference picture signal to generate a video code stream, encoding the reference picture signal to generate a reference picture code stream, and multiplexing the video code stream with the reference picture code stream to generate an output code stream, where there is provided a picture encoding apparatus comprising a receiving unit configured to receive an input video signal, a first encoding unit configured to encode the video signal by using a reference picture signal to generate a video code stream, a second encoding unit configured to encode the reference picture signal to generate a reference picture code stream, and a multiplexing unit configured to multiplex the video code stream and the reference picture code stream to generate an output code stream and the picture decoding method which comprises receiving an input code stream containing a video code stream obtained by encoding a video signal and a reference picture code stream obtained by encoding a reference picture signal, decoding the reference picture code stream contained in the input code stream to generate a first reference picture signal, and decoding the video code stream contained in the input code stream by selectively using one of a second reference picture signal obtained from a previous picture signal and the first reference picture signal to generate a playback picture signal.

Claims 2-4, 6, 17 and 14-16, 18 are allowed since they depend on claims 1 and 11 respectively.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

Art Unit: 2473

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
